

Detaseal® hydroflow ultimate hydrophilicity

The initial flowing characteristic of an elastic impression material on surfaces with residual moisture is one of the most decisive criteria for highly precise elastic impressions. **Detaseal® hydroflow** possesses this essential hydrophilic property, this being immediately on application and over the entire working time.

7 surface-active products form a coordinated system – putty and wash are matched 100% to one another and satisfy the highest demands with regard to detail accuracy, fluidity, flexible working times and comfort of the patient.

Detaseal® hydroflow putty has a smooth and high consistency and can be removed easily after a dwell time in the mouth of only 2 minutes. In combination with the two correction materials **Detaseal® hydroflow lite** and **Detaseal® hydroflow Xlite** (both available in two different setting times) the material is suitable both for the double mix technique and for the sandwich technique and offers more flexibility in elastic impression taking. The correction materials form only a thin layer over the preliminary impression. The result is elastic impressions of high dimensional accuracy and an exact representation of the preparation limits.

The product line comprises putty, tray material in 5:1 hard cartridges, monophase as well as 2 correction compounds – a variety of contrasts and different setting times, for maximum flexibility in working and more pleasure in impression taking.
