THE NEW NITI FILE GENERATION

# HyFlex<sup>™</sup> CM & EDM

MM

## Stays on track

## **HyFlex**<sup>™</sup> EDM Electrical Discharge Machining

The new HyFlex EDM files constitute the 5th generation root canal files. HyFlex EDM NiTi files have completely new properties due to their innovative manufacturing process using electric discharge machining. Workpieces are machined in the EDM manufacturing process by generating a potential between the workpiece and the tool. The sparks generated in this process cause the surface of the material to melt and evaporate.

This creates the unique surface of the new Niti files and makes the HyFlex EDM files stronger and more fracture resistant. This entirely unique combination of flexibility and fracture resistance makes it possible to reduce the number of files required for cleaning and shaping during root canal treatments without having to compromise preservation of the root canal anatomy.

Just like HyFlex CM files, HyFlex EDM files have the already familiar controlled memory effect (CM). This results in very similar properties in terms of material flexibility and regeneration.

- ightarrow Up to 700 % higher fracture resistance
- ightarrow Specially hardened surface
- ightarrow Less filing required for treatment success

### **Clinical Cases**

*"These files definitely know their way around curves. That's for sure. I love them!"* 

Dr. Antonis Chaniotis

#### $\rightarrow$ High flexibility

- $\rightarrow$  Extreme resistance to fracture
- $\rightarrow$  Centred canal preparation

HyFlex files are manufactured utilising a unique process in which the crystallographic phase transitions from austenite to martensite at room temperature in contrast to conventional NiTi files, making the files extremely flexible and fracture resistant.

Due to the controlled memory, the files always follow the anatomy of the canal, thus significantly reducing the risk of ledging, transportation or perforation of a canal. Like stainless steel files, the HyFlex files can be pre-bent.

This is a crucial advantage in extremely curved root canals to avoid the creation of steps.

#### Up to 700% higher fracture resistance

Tests have shown that HyFlex NiTi files are significantly more resistant to fatigue than conventional NiTi files. In the new HyFlex EDM NiTi files, this effect is further increased by 300-700 %. The new EDM manufacturing process results in another form fit and hardness of the surface of the file.

## → Fracture resistance by visual inspection → Regeneration by thermal treatment

HyFlex NiTi have a built-in shape memory. They prevent stress during preparation by changing their spiral shape. They regain their shape after heat treatment. A normal autoclaving process is enough to return the files to their original shape and to regenerate the crystal structures and resistance to fatigue. Should the file fail to regain its shape after heat treatment, it is plastically deformed, thus increasing the risk of fracture. These files should not be used after visual inspection. The number of reuses, which can be determined by the user by visual inspection, is higher than that of conventional NiTi files.

#### **HyFlex**<sup>™</sup>EDM Reduced Number of Files

Depending on the clinical situation, use of HyFlex EDM files reduces the number of files to 2-3 pieces particularly in straight and larger canals.

All HyFlex EDM NiTi Files can be used at 400 rpm and at a torque of up to 2.5 Ncm (25 mNm) excepted the Glidepath files which can be used with 300 rpm and at a torque of up to 1.8 Ncm (18 mNm).

#### **HyFlex**<sup>™</sup>CM Single Length Technique

The single length technique, in which all files are used except the short Orifice Opener up to the working length, allows accurate and anatomically accurate preparation using HyFlex CM files.

Again, all files can be used except the Orifice Opener up to the working length (500 rpm; 2.5 Ncm (25 mNm)).

#### **Regeneration by thermal treatment**

## **HyFlex**<sup>™</sup>GPF Glide Path File

The HyFlex GPF ensure optimal shaping of the glide path due to the controlled memory. They are characterized by good durability and resistance to fracture. Despite the extreme flexibility that allows the files to follow unusual anatomies, the HyFlex Glide Path Files are very easy to use and ensure safe treatment.

The HyFlex CM Introkit Compact is an optimal choice for starting a successful endodontic treatment.

In this compact set, the reliable HyFlex CM Sequence is arranged for using the single length technique together with space-saving storage and guttapercha points tailored to the system. The set allows optimal access to the highquality COLTENE ENDO product range. In a small starter set, the HyFlex EDM Introkit Compact offers 4 file sizes with which treatments, particularly of straight canals, can be preformed very simply to ISO size 40. Like all HyFlex NiTi files, the HyFlex EDM are presterilised and together with the small, practical HyFlex Organizer and dimensionally correct Greater Taper guttapercha points, treatment can be started immediately.

#### HyFlex CM Introkit:

- 1 × HyFlex Organizer
- 1 × HyFlex CM NiTi File Refill Sequence 25 mm
- 1 × ROEKO Guttapercha Points Greater Taper 0.04, Assorted 20-45

#### **HyFlex EDM Introkit:**

- 1 × HyFlex Organizer
- 1 × HyFlex EDM Shaping Set Simple + 40/.04 Finisher File
- 1 × ROEKO Guttapercha Points Greater Taper 0.04, Assorted 20-45
